

## Rational algebra

1.  $\Pi$  books ( $\sigma_{\text{inventory} = \text{existing}}$ )
2.  $\Pi$  purchases( $\sigma_{\text{Status NOT LIKE 'buy'}}$ )
3.  $\Pi$  customers
4.  $\Pi$  suppliers
5.  $\Pi$  purchases( $\sigma_{(\text{purchases.purchase\_date} \geq y1 \wedge \text{purchases.purchase\_date} \leq y2)}$ )
6.  $\Pi(\text{books} \bowtie \text{discount})(\sigma_{\text{discount.global\_discount} \neq 0})$
7.  $\Pi$  storage( $\sigma_{(\text{storage.is\_exists\_in\_storage} = \text{yes} \wedge \text{storage.s\_number} = x)}$ )
8.  $\Pi$  suppliers( $\sigma_{\text{suppliers.first\_name}, \text{suppliers.last\_name} \wedge \text{suppliers.s\_number} = x}$ )
9.  $\Pi$  purchases( $\sigma_{\text{purchases.s\_number} = x \wedge \text{purchases.purchase\_date} \geq y}$ )
10.  $\Pi(\text{customer} \bowtie \text{order to customer})$   
( $\sigma_{\text{order\_To\_customer.how\_much\_items\_per\_customer}, \text{customer.first\_name}, \text{customer.last\_name} \wedge \text{customer.date\_order} \geq y}$ )

11.  $\Pi$  purchases ( $\sigma_{\max(\text{purchases.customer\_id} \wedge \text{purchases.status}=\text{buy} \wedge \text{purchases.purchases\_date} \geq y)}$ )

12.  $\Pi$  (suppliers  $\bowtie$  order from suppliers) ( $\sigma_{\max(\text{order\_from\_supplier.how\_much\_items\_has\_ordered}), \text{suppliers.first\_name}, \text{suppliers.last\_name} \wedge \text{order from suppliers.date\_suppliers\_order} \geq y}$ ).

13.  $\Pi$  order\_from\_suppliers ( $\sigma_{\text{sum}(\text{orders\_from\_supplier.order\_supplier\_number} \wedge (\text{order\_date}=y1 \wedge \text{order\_date}=y2))}$ )

14.  $\Pi$  purchases ( $\sigma_{\text{sum}(\text{purchases.s\_number} \wedge \text{purchases.status}=\text{buy}) \wedge (\text{order\_date}=y1 \wedge \text{order\_date}=y2)}$ ).

15.  $\Pi$  business revenue ( $\sigma_{\text{sum}((\text{amount})/3) \wedge (\text{business\_revenue}=q1, q2, q3) \ \&\&((\text{amount})/1) \wedge (\text{business\_revenue}=q4)}$ )).

16.  $\Pi$  (discount  $\bowtie$  order to customer) ( $\sigma_{\text{sum}(\text{discount.local\_discount}) \wedge (\text{order\_to\_customer.date\_order}=y)}$ ).

17. customers ( $\sigma_{\text{count}(\text{customer.customer\_id} \wedge (\text{customer.join\_date} \geq y))}$ ).

18.  $\Pi$  (purchases  $\bowtie$  order from suppliers) ( $\sigma_{(\text{sum}(\text{order\_from\_supplier.price}) \wedge (\text{purchases\_date}=y1 \wedge \text{purchases\_date}=y2))}$ ).

19.  $\Pi(\text{worker}) (\sigma(\text{sum}) \text{worker.sales},$   
 $\text{worker.first\_name}, \text{worker.last\_name})^{(\text{selling\_date}=\text{y1}$   
 $\wedge \text{selling\_date}=\text{y2}))$ .

20. .  $\Pi(\text{purchases} \bowtie \text{books}) (\sigma(\text{distinct}) \text{book.title})^{$   
 $(\text{purchases\_date}=\text{y1} \wedge \text{purchases\_date}=\text{y2})^{$   
 $(\text{purchases.status}=\text{buy}))$ .
